SK

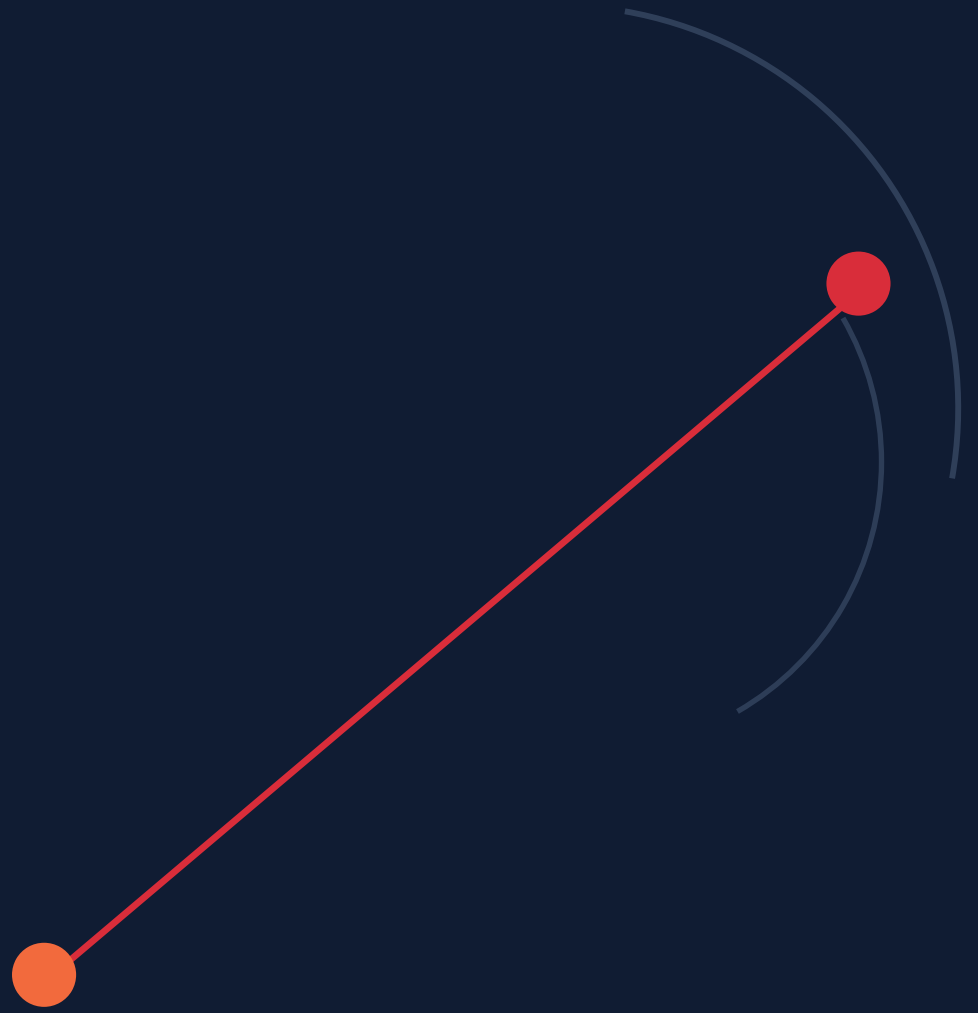

SUPERK-TAXI / KOREA

Deep Dive Strategy Presentation

Winning the right to be Korea’s dependable #2

CEO x Asia Regional Strategy Head

Discussion draft | May 2024 | H2 decisions start in August

CONFIDENTIAL • STRATEGY DISCUSSION

South Korea

The market is not short on apps - it is short on reliable, incremental supply

A network-effects leader sets the bar; SuperK-T must win on dependable completed trips, not download share.

~90% [1]

Kakao T's estimated share of app-mediated taxi calls; public estimates vary by denominator.

~250k [2][3]

Licensed taxi vehicles nationwide - but a licensed vehicle is not an online driver-hour.

₩4,800 [4]

Seoul base fare since Feb 2023; regulated fares constrain discount-led differentiation.

Why the incumbent is hard to dislodge

- Demand density compounds: more requests improve match rates; stronger supply attracts more riders.
- Default behavior is sticky: brand familiarity, broad service coverage, payment and mobility adjacencies.
- The regulator is watching platform conduct: KFTC sanctioned Kakao Mobility over preferential dispatching of affiliated taxis in 2023.

Three imperatives for SuperK-T

- Concentrate on a few high-intent zones and dayparts before buying national reach.
- Treat driver hours, pickup reliability and Korean-language support as the product.
- Use the rebrand as permission to reappraise - then earn trust with a visibly better first trip.

STRATEGIC CHOICE **Do not buy installs. Buy incremental completed trips and active driver hours.**

Sources: [1]-[4] | Market-share estimate is not an audited, official share.

A focused #2 strategy: be the dependable alternative where intent is strongest

The goal is not to mirror Kakao T nationally; it is to become the best backup in moments when reliability matters most.

WHERE TO FOCUS FIRST

01 **Airport & inbound travel**
Pre-booking, hotel referrals, clear pickup instructions and reliable luggage-friendly service.

02 **Business travel**
Recurring weekday demand, centralized billing, receipts and service-level visibility for employers.

03 **Late-night urban trips**
High pain from long waits and cancellations; focus on safe, predictable pickups in dense districts.

04 **Neighborhood repeat**
Convert first rides into habit with saved locations, Korean support and consistent dispatch quality.

HOW TO BUILD A LOCAL FLYWHEEL

1 **Anchor demand**
Airports, hotels, employers, hospitals

2 **Stage supply**
Drivers online in chosen zones / hours

3 **Deliver certainty**
Fast match, clear pickup, low cancels

4 **Earn repeat**
Rebook, referrals, account expansion

POSITIONING **“The taxi app that shows up when you need it.”**

Reliability and local usability are the wedge; partnerships are the distribution engine.

Resource rule **Fund corridors and cohorts with a measurable path to repeat; do not subsidize broad, one-off demand.**

Sources: [1], [5], [6] | Segment focus and flywheel are strategic recommendations.

Make driver economics and workflow the first product

The binding constraint is usable driver-hours at the right place and time - not the number of cars with taxi plates.

01 Recruit usable supply

- Sign anchor corporate fleets in Seoul and Incheon; add airport corridor coverage.
- Launch a time-limited, conditional activation offer: reward completed incremental trips, not app sign-up.
- Concentrate incentives on pre-defined shortage windows and pickup zones.

02 Make drivers stay

- Show fare, commission and payout clearly before acceptance; provide next-day settlement.
- Offer Korean-language driver support, fast issue resolution and practical onboarding.
- Reduce dead time with demand heatmaps, pickup pin quality and transparent dispatch explanations.

03 Unlock the long tail

- Build a simple owner-operator onboarding path for private-taxi and smaller fleet partners.
- Let drivers multi-home; win share of their online hours through reliable demand and fair terms.
- Equip fleet managers with utilization, cancellations and settlement dashboards.

H2 SUPPLY OUTCOME **2x weekly active driver supply in selected zones by Jan 2025 (proposed target; set Aug baseline first).**

Sources: [2], [3], [5] | Target is a recommendation, not a company forecast.

Win on first-trip trust, then habituate the highest-value cohorts

Acquire through moments of need and trusted local partners; convert through a Korean-native booking and support experience.

SEGMENT-LED ACQUISITION

Business accounts	Employer / travel-manager pilots; centralized billing and receipts.
Airport & hotels	Hotel concierge, inbound guide and airport pickup partnerships; precise meeting-point flows.
Night-time urban	Use venue, campus and event channels; safety cues and pickup certainty, not blanket coupons.
Local repeat	Referral after a completed trip; saved homes / offices and low-friction rebooking.

KOREAN-FIRST CONVERSION BASICS

- Korean default language, natural error messages and local-language support - before launch.
- Address/POI search that handles Korean names, building entrances, stations and exact pickup pins.
- Local phone verification and familiar card / wallet payment flows; instant digital receipts.
- Trust cues in the ride: vehicle/driver details, safety assistance, transparent fare and cancellation terms.
- Korean operations team owns App Store / Play reviews and closes the loop on top complaint drivers.

ACQUISITION RULE **Reward incremental completed trips and 30-day repeat - not app installs or coupon redemptions alone.**

Sources: [4], [6] | Product and channel recommendations are proposed.

Run H2 as a set of local experiments - not a national launch

Aug 2024-Jan 2025 | Sequence investment behind service quality, repeat and unit-economics gates.

AUG-SEP | PROVE

Seoul + airport corridor

- Baseline supply / ETA / cancels in selected zones.
- Launch anchor fleets, driver support and Korean UX fixes.
- Test B2B, hotel and night-time channels.

OCT-NOV | SCALE

Deepen winning dayparts

- Expand only zones with reliable match and pickup.
- Add account partners; retarget first-trip riders.
- Tune incentives against incremental trip lift.

DEC-JAN | EXTEND

Selective city expansion

- Enter Busan or other city only after Seoul gates pass.
- Replicate playbook with local fleet / partner leads.
- Prepare 2025 investment case on observed economics.

AUG BASELINE → QUALITY GATES (PROPOSED)

SUPPLY	RELIABILITY	RETENTION	ECONOMICS
2x weekly active drivers in chosen zones	**+10pp request-to-match completion; -15% pickup ETA**	**+5pp 30-day repeat vs. Aug cohort baseline**	**Positive contribution / trip for mature cohorts within 90d**

Gate logic: hold or redirect spend if reliability misses; release incentives only when matched to incremental, completed rides.

Planning targets are illustrative; reset after first 2 weeks of measured baseline.

Build durable advantage through trust, partnerships and cleaner trips

Long-term leadership should compound service quality - without creating avoidable regulatory or capital risk.

0-6 MONTHS

Trust + compliance by design

- Keep supply licensed and platform arrangements legally reviewed.
- Log dispatch inputs and outcomes; monitor cancellation, ranking and affiliate exposure.
- Minimize personal data; explain safety, fare and dispute flows in Korean.

6-18 MONTHS

Open distribution + smart ops

- Integrate booking / settlement with employers, hotels and travel partners.
- Use demand forecasts to stage supply and reduce driver idle / empty time.
- Pilot EV taxi partnerships where charging, lease terms and utilization pencil out.

18-36 MONTHS

A trusted mobility layer

- Add compliant accessible and senior-friendly service through licensed partners.
- Expand multimodal / business mobility only where it raises repeat and contribution.
- Scale lower-emission supply with measured cost and emissions per completed trip.

NON-NEGOTIABLE GUARDRAILS

No unlicensed rides | no opaque self-preferencing | fair driver terms | privacy-by-design | EV scale only after TCO proof

Sources: [1], [6], [7] | Roadmap is a recommendation, subject to pilot proof.

DISCUSSION

Q&A

Which two Seoul corridors and customer cohorts should we commit to first?

What level of H2 investment is justified by the service and payback gates?

What regulatory / partner risks need CEO sponsorship now?

Recommended decision today: authorize an Aug-Sep proof phase; gate scale on service quality and unit economics.

Public sources and how to read the numbers

Evidence cutoff: May 2024. Use source documents in Korean where available; market shares and taxi statistics depend on denominator and reporting period.

[1] Korea Fair Trade Commission (KFTC)	Decision / press release on Kakao Mobility taxi-call market conduct and preferential dispatching, 28 Dec 2023. Official source: ftc.go.kr. Supports competitive dominance and regulatory scrutiny.
[2] KNTCA / Taxi Associations	Korea National Joint Conference of Taxi Associations, Taxi Statistics (택시통계), latest available by May 2024; taxi.or.kr. National licensed taxi stock / fleet structure.
[3] Korea Transportation Safety Authority (TS)	Taxi transport statistics / Transport Safety Information Management System (T-MACS); kotsa.or.kr. Cross-check for registered fleet and operating context.
[4] Seoul Metropolitan Government	Taxi fare adjustment effective 1 Feb 2023; seoul.go.kr. Seoul daytime base fare raised to ₩4,800 (with other fare elements also revised).
[5] Ministry of Land, Infrastructure and Transport (MOLIT)	Taxi service improvement and late-night supply policy measures, 2022; molit.go.kr. Context on driver availability, service hours and sector reform.
[6] Korea Law Information Center	Passenger Transport Service Act and Enforcement Decree (여객자동차 운수사업법), as in force through May 2024; law.go.kr. Licensing / platform legal framework.
[7] Ministry of Environment	2024 EV subsidy guidance and local taxi electrification programs; ev.or.kr and municipal notices. Informs the proposed pilot, not a pre-judgment on taxi TCO.

CAVEAT **~90% is a reported app-call estimate, not an audited market-share statistic; do not equate taxi fleet count with online supply.**

Assumptions, investment gates and CEO choices

Company-specific operating data was not provided; this deck is a decision framework, not a forecast or valuation.

WHAT WE ASSUME / MUST VALIDATE

- SuperK-T has a relaunch-ready consumer brand, but Korea awareness and repeat are unproven.
- A licensed-taxi model is the H2 core; any adjacent service requires separate legal / permit review.
- Current SuperK active-driver, conversion, retention, CAC and contribution data are not available in this brief.
- Targets are relative to a two-week August baseline and must be reset if underlying unit economics disagree.
- Anchor fleet, airport, hotel and employer partnerships can be negotiated; none are assumed signed.

CEO / REGIONAL STRATEGY DECISIONS

1. Approve an Aug-Sep proof phase in selected Seoul + airport zones.
2. Name Korea GM owners for supply, Korean UX, B2B partnerships and service recovery.
3. Authorize conditional incentives tied to completed incremental rides and defined quality gates.
4. Set legal / compliance review before any fleet-franchise, dispatch-ranking or fare experiment.
5. Return in October with observed cohort economics and a gated scale recommendation.
