SUPERK-TAXI KOREA

Deep Dive Strategy Presentation

Build Korea's credible #2— one reliable pickup at a time.

DECISION / KRW12bn staged H2 pilot • Launch from August 2024

New Korea CEO × Asia Regional Strategy Head | Head of Strategy | May 2024

Working assumption: SuperK-T is an anonymized Uber Taxi / former UT; public facts are used as proxies.
No internal baseline supplied. Offline research basis and verification requirements are disclosed in Appendix A1–A2.

The rebrand is a doorway—not a right to win

A new name helps discovery; reliable local supply and a Korean-native trip experience must earn the second booking.

94%

Kakao share of general taxi-hailing, 2021 [S1]

KRW4,800

Seoul standard taxi base fare since Feb 2023 [S2]

11.03m

2023 inbound visitors; 63% of 2019 volume [S3]

COMPETITIVE REALITY	WHAT IT MEANS FOR SUPERK-T
Kakao T: default habit + liquidity	Do not match nationwide coupon spend. Concentrate available cars and repeat demand in six Seoul service cells.
Tada / i.M / local operators: niches	Premium and local service can coexist with the leader. Win airport, late-work and business use cases—not every trip.
SuperK-T: rebrand + global bridge [S4]	Use global-account familiarity and permitted TMAP channels; close address, payment and service gaps before broad acquisition.

STRATEGIC IMPERATIVE / Concentrate → prove pickup reliability → earn repeat use → expand.

94% is historical broker-market share, not May 2024 MAU or all taxi trips. Current SuperK-T share, active supply and rank are unverified; baseline by June.

Buy productive driver hours, not logos on cars

Launch six Seoul cells around Gangnam, Yeouido and Jongno work / nightlife nodes; treat airport access as a separate operating lane.

RECRUIT AND RETAIN LICENSED SUPPLY

- Contract 4,000 corporate-fleet drivers + 6,000 owner-drivers by December; target 80% activation, not just signed logos.
- Offer fast settlement, Korean driver support and transparent earnings. Allow multi-homing; no rival-app deletion or exclusivity.
- Pay for incremental peak coverage and completed rides: ~KRW1,000 per ride average, including capped guarantees.
- Start with fleet depots and taxi-association listening groups; weekly onboarding clinics, payment tests and driver referral checks.

RUN A CELL-LEVEL RELIABILITY SYSTEM

- Staff two peaks first: 07–10 and 22–02. Forecast requested rides, available cars and pickup time by 500 m cell / 30 minutes.
- Dispatch nearest suitable licensed supply; audit assignment fairness, refusal patterns, cancellations and low-coverage areas.
- Use fleet shift commitments and break / charging plans. Do not mistake a licensed taxi or certified driver for an available shift.
- Pause rider acquisition when pickup reliability fails. Redeploy incentives only where a controlled test adds active vehicle-hours.

8,000	1.06m	≥85%	≤8 min
Monthly productive drivers	December rides / month	Request-to-completion	P90 pickup in launch cells

Localize the trip, then pay for repeat use

Demand budget: KRW2.0bn. Prioritize need states where a reliable alternative solves a real problem; do not buy unserviceable installs.

60% / SEOUL REPEAT USERS

Late-work commuters + short urban trips

- Acquire through employer night-shift deals and cell-level referrals. Trigger a second-trip offer only after a successful pickup.

25% / INBOUND VISITORS

Airport → hotel → return journey

- Partner with hotels / travel sellers; use permitted airport pickup zones. Test global accounts, foreign cards and no-Korean-SIM flows.

15% / CORPORATE ACCOUNTS

Predictable off-peak and shift demand

- Pilot 20 employers / hotels: invoicing, policy controls and reserved taxi capacity. Reservations only against committed licensed supply.

AUGUST PRODUCT RELEASE: FOUR NON-NEGOTIABLES

Find me

Hangul road / lot addresses; building names and entrance pins.

Let me pay

Domestic card / local-wallet integration subject to partner approval.

Make it clear

Honest ETA and meter-based estimate; clear tolls and cancellation rules.

Fix it fast

Korean chat / voice, lost-property workflow and 24/7 incident routing.

Targets: local-resident D30 repeat ≥35%; new transacting rider CAC ≤KRW3,000. Hold out 10% of eligible users; measure incremental completed trips, not installs.

Compliance and service quality are the growth model

By 31 July: local counsel signs off the operating model; Operations owns one auditable driver-to-rider service scorecard.

BOUNDARY	ACTION / NO-GO RULE	ACCOUNTABLE OWNER
Licensed model	Confirm Type 3 brokerage registration; franchise activity only within approved Type 2 arrangements. No unlicensed private-car supply. [S6]	**Legal + GM** **Sign-off before August**
Pricing + dispatch	Use approved meter / call-fee rules; no unapproved surge. Transparent ranking; no self-preferencing or competitor lockout. [S1, S5]	**Legal + Product** **Monthly dispatch audit**
People + safety	Validate taxi / driver status and insurance; respect rest and employment rules. Freeze unsafe supply, preserve logs, investigate and remediate. [S6–S8]	**Head of Operations** **Daily incident review**
Data + location	Minimize collection; review overseas transfers, retention, location consents and vendor access before connecting global / TMAP data. [S9, S10]	**Privacy lead + Security** **Release-level assessment**

WEEKLY CONTROL ROOM / Korea GM owns supply, pickup reliability, repeat use, contribution and safety.

Operating guardrails: driver cancellations ≤5%; P90 first safety response <10 min; critical incidents reviewed within 24h. Targets, not current performance.

Build a defensible network—not a permanent coupon business

Leadership comes from useful contracts, better operating data and lower fleet cost—not a speculative private-car or autonomous launch.

RELIABILITY INTELLIGENCE

AUG–DEC 2024

Prediction + Korean service layer

- Instrument request-to-pickup by cell; forecast peaks and suggest voluntary repositioning.
- In 2025, trial pre-booked, accessible taxi matching with licensed specialist fleets; no availability promise without capacity.

Gate: fewer failed pickups in holdout tests; no rise in driver deadheading.

CONTRACTED DEMAND

2025 SCALE

B2B + traveler distribution

- Convert employer / hotel pilots into recurring demand commitments and licensed-fleet SLAs.
- Test approved B2B service fees and franchise economics; keep ordinary hails fee-free unless explicitly authorized and disclosed.

Gate: paid contracts, positive cohort contribution and fixed-cost coverage at scale.

LOWER-COST, CLEANER FLEETS

Q4 2024 PILOT → 2025

EV economics before EV optics

- Pilot 100 licensed EV taxis with depot charging; confirm subsidy eligibility, but assume none.
- Scale only at ≥5% lower total cost and unchanged peak coverage; include leases, charge downtime and battery / winter risk.

Gate: measured cost per productive hour; report energy and estimated emissions separately.

EV illustration only: 180 km/day × 22 days × KRW50/km energy saving = KRW198,000/month before lease / charging costs. Do not claim emissions avoided without a defensible baseline.

Release KRW12bn in tranches; scale only when cells work

Proposed gross incremental envelope for August–December 2024; no assumed revenue offsets. June–July preparation uses existing teams.

USE OF FUNDS / KRW bn

Supply incentives + onboarding	4.00
Rider incentives + CRM	2.00
Local product / operations squad	3.00
Variable fulfilment + trust / legal	1.35
Contingency; CFO controlled	1.65
TOTAL	**12.00**

16-FTE dedicated cross-functional squad; local GM owns P&L and weekly reallocation.

TRANCHES / RELEASE AGAINST PROOF

AUG–SEP / 4bn

Six-cell launch; September target 0.50m rides. Before launch: legal sign-off, tested payments and minimum peak supply.

OCT–NOV / 5bn

Expand only after four weeks ≥85% completion, P90 pickup ≤8 min and D30 local repeat ≥35%. November: 0.85m rides.

DECEMBER / 3bn

Target 8,000 productive drivers and 1.06m rides. Do not release expansion spend without approved monetization and credible non-negative normalized contribution.

2025 AMBITION / 20k productive drivers → 3.08m monthly rides; national #2 and ~10% app-hail share are conditional goals.

CEO asks: approve gated envelope + local product authority; sponsor fleet / employer deals. Kill broad expansion if legal clearance, reliability or economics gates fail.

Q&A

Three decisions for today

- Approve KRW12bn as a conditional, staged investment—not a nationwide marketing cheque.
- Give Korea one accountable GM and a dedicated local product / data / operations squad.
- Back licensed fleet and employer partnerships; stop expansion when service or economic proof fails.

Appendices follow: public evidence • taxi-supply diligence • model and sensitivities • execution scorecard

Market anchors: definitions matter more than headline precision

Source cutoff: 31 May 2024. Official landing links are provided for document retrieval; exact deep links and editions have not been live-verified.

S1 / COMPETITION

KFTC • 14 Feb 2023 • Kakao Mobility enforcement

94% general taxi-hailing share in 2021; KRW25.7bn penalty announced. Historical broker-market evidence, not a May 2024 share estimate.

https://www.ftc.go.kr/eng/

S2 / FARE REGIME

Seoul Metropolitan Government • effective 1 Feb 2023

Standard medium-taxi base: KRW4,800 for 1.6 km. Do not extrapolate Seoul to all Korea or assume platform surge rights.

https://english.seoul.go.kr/

S3 / INBOUND DEMAND

Korea Tourism Organization • annual tourism statistics

2019: 17,502,756 arrivals; 2023: 11,031,665. Recovery = 63.0%. Visitor arrivals are not ride demand or unique taxi users.

https://datalab.visitkorea.or.kr/

S4 / REBRAND

Uber / UT • March 2024 • Korea rebranding announcement

UT became Uber Taxi. Used solely as the SuperK-T proxy; no public claim on SuperK-T share, supply or conversion is made.

https://www.uber.com/kr/en/newsroom/

S5 / SUPPLY POLICY

MOLIT • 4 Oct 2022 • late-night taxi-shortage measures

Historical evidence of supply / service mismatch and policy intervention. Current local operating conditions require 2024 verification.

https://www.molit.go.kr/english/

Research limitation: offline compilation; primary documents were not retrieved in-session. Validate exact figures / editions before releasing funds. Forecasts are not sourced facts.

Reconcile taxi stock, driver eligibility and actual available shifts

Do not confuse industry vehicle registrations, certified drivers, company sign-ups and online taxi-hours.

SOURCE / PRE-MAY-2024 EDITION TO RETRIEVE	HOW IT CHANGES THE PLAN
S7 / Korea Transportation Safety Authority (TS) **Taxi operation / driver qualification information** https://www.kotsa.or.kr/	Match licensed driver and vehicle records; identify active shifts, mileage, empty running and safety patterns where accessible. Eligibility ≠ live supply.
S8 / Korea National Joint Conference of Taxi Associations **Latest published taxi vehicle / driver status tables** https://www.taxi.or.kr/	Reconcile corporate vs owner-driver stock by region. Build a recruitable-supply ceiling; do not apply a national availability rate to Seoul.
S6 / Passenger Transport Service Act + rules **Version in force by 31 May 2024** https://www.law.go.kr/	Local counsel confirms Type 2 / Type 3 scope, service areas, fare / call-fee limits, reservations and airport operating rights.
S9 / PIPC guidance; S10 / Location Information Act **Rules effective by 31 May 2024** https://www.pipc.go.kr/eng/	Privacy lead maps global transfers, lawful basis, retention, location consent, vendor access and breach escalation.
S11 / Ministry of Environment **2024 EV subsidy and eligibility guidance** https://www.me.go.kr/eng/	EV pilot uses no subsidy in base case; confirm vehicle, taxi-use and local eligibility before any subsidy is booked.

No TS / association numeric series was available offline. No precise fleet-size, age or operational-supply claim is attributed to these sources.

June diligence: Strategy + Ops reconcile latest pre-cutoff tables, definition, geography and active status with internal dispatch logs; no later-than-May hindsight.

The ambition is feasible only if monetization is proven

All figures below are planning assumptions; no current company run-rate, market denominator or fee entitlement has been supplied.

VOLUME AND CASH MODEL

Monthly ride ramp (millions)

Aug 0.350 | Sep 0.500 | Oct 0.650
Nov 0.850 | Dec 1.056 → Total 3.406m

- December 2024: 8,000 productive drivers × 22 earning days × 6 our trips/day = 1.056m rides.
- December 2025: 20,000 × 22 × 7 = 3.08m rides. A productive driver has ≥10 earning days; the 22-day mean is unverified.
- 2024 incentives: KRW1,000 driver + KRW500 rider × 3.406m = KRW5.109bn; onboarding / CRM KRW0.891bn.
- Other costs: variable KRW250/ride = 0.852bn; product / ops 3.0bn; trust / legal 0.5bn; buffer 1.648bn. Gross spend = 12.0bn.

UNIT ECONOMICS / MARKET-SHARE TEST

Illustrative fare KRW14,000; variable cost KRW250.
"Yield" is net platform revenue / fare—not a proposed rider surcharge.

Net yield	0%	3%	5%
Revenue / ride	0	420	700
Pilot CM / ride	−1,750	−1,330	−1,050
Normalized CM	−400	20	300

CM = revenue − KRW250 − incentives (pilot KRW1,500; normalized KRW150). Excludes fixed costs; incentive decay is unproven.

At 3.08m rides and KRW0.7bn monthly fixed cost, break-even needs ~4.5% net yield. 3% is not a scalable business.

3.08m rides / market of 25m → 12.3%; 35m → 8.8%; 45m → 6.8%. Denominator scenarios, not forecasts.

0% yield is the funded base case. 3% yield would add KRW1.43bn pilot revenue but is unapproved. Confirm paid-product mix, fee rights and willingness to pay.

A 100-day reset with explicit owners and stop rules

One weekly CEO dashboard; Korea GM accountable end-to-end. No vanity downloads, inflated vehicle sign-ups or aggregate-only service metrics.

JUNE–AUGUST / OWNERS + DELIVERABLES

BY 14 JUNE / STRATEGY + FINANCE

Validate public anchors; reconcile TS / association scope; extract 13 weeks of internal requests, trips, spend and active driver-hours.

BY 30 JUNE / OPS + PARTNERSHIPS

Set six cell boundaries; sign anchor fleets; confirm vehicle / driver eligibility and airport rules; secure employer / hotel pilots.

BY 31 JULY / PRODUCT + LEGAL

Ship Korean UX tests, payment QA and safety routing; complete fee / data / dispatch approvals and baseline cell dashboards.

1–31 AUGUST / GM + GROWTH

Launch in controlled waves. Hold out 10% for promo incrementality; review supply daily and contribution by acquisition cohort weekly.

MEASURE PRECISELY / ACT ON FAILURE

Service
Completion = completed / valid requests; P90 pickup = request-to-arrival, with unfulfilled requests reported separately. Gate ≥85% / ≤8 min by cell and peak.

Supply + retention
Productive drivers = unique drivers with ≥10 earning days / month. D30 repeat = acquired local residents taking ≥2nd completed trip within 30 days. Gate ≥35%.

Economics + share
CAC = acquisition spend / new transacting riders; target ≤KRW3k. CM subtracts variable cost and both incentives. Share = our completed app-hails / market app-hails, same scope.

Stop / remediate
If service fails for two weeks: freeze rider promos in that cell. If legal sign-off or credible monetization is absent: freeze expansion; CEO reviews partner terms or narrower footprint.

NATIONAL #2 / Validate with trip-based panels + partner data; never substitute MAU for completed-ride share.

Causal check: reward incremental supply-hours, use promo / geo holdouts with contamination checks, and separate tourist one-off journeys from resident retention.
